Semantic Roles & Labeling

LING 571 — Deep Processing in NLP
November 16, 2022
Shane Steinert-Threlkeld

Announcements

- HW7:
 - Be careful with 0s (e.g. log, divide by 0)
 - Similarity vs. distance
 - Detailed readme! How did you treat sentence boundaries?

scipy.spatial.distance.COSine(u, v, w=None)

Compute the Cosine distance between 1-D arrays.

The Cosine distance between u and v, is defined as

$$1 - \frac{u \cdot v}{||u||_2 ||v||_2}.$$

where $u \cdot v$ is the dot product of u and v.

Parameters:

u: (N,) array_like
Input array.

v: (N,) array_like
Input array.

w: (N,) array_like, optional

The weights for each value in *u* and *v*. Default is None, which gives each value a

weight of 1.0

Returns:

cosine : double

The Cosine distance between vectors *u* and *v*.

Ambiguity of the Week

Ambiguity of the Week

Ambiguity of the Week

Semantic Roles

Semantic Analysis

- Full, deep compositional semantics
 - Creates full logical form
 - Links sentence meaning representation to logical world model representation
 - Powerful, expressive, Al-complete

Semantic Analysis

- Full, deep compositional semantics
 - Creates full logical form
 - Links sentence meaning representation to logical world model representation
 - Powerful, expressive, Al-complete
- Domain-specific slot-filling:
 - Common in dialog systems, IE tasks
 - Narrowly targeted to domain/task
 - e.g. ORIGIN_LOC, DESTINATION_LOC, AIRLINE, ...
 - Often pattern-matching
 - Low cost, but lacks generality, richness, etc

Semantic Role Labeling

- Typically want to know
 - Who did what to whom
 - ... where, when, and how

Semantic Role Labeling

- Typically want to know
 - Who did what to whom
 - ... where, when, and how
- Intermediate level:
 - Shallower than full deep composition
 - Abstracts away (somewhat) from surface form
 - Captures general predicate-argument structure info
 - Balance generality and specificity

Examples

Yesterday Tom chased Jerry
Yesterday Jerry was chased by Tom
Tom chased Jerry yesterday
Jerry was chased yesterday by Tom

Examples

Yesterday Tom chased Jerry Yesterday Jerry was chased by Tom Tom chased Jerry yesterday Jerry was chased yesterday by Tom

- Semantic roles:
 - Chaser: Tom
 - Chased Thing: Jerry
 - TimeOfChasing: yesterday

Examples

Yesterday Tom chased Jerry Yesterday Jerry was chased by Tom Tom chased Jerry yesterday Jerry was chased yesterday by Tom

- Semantic roles:
 - Chaser: Tom
 - Chased Thing: Jerry
 - TimeOfChasing: yesterday
- Same across all sentence forms

Full Event Semantics

- Neo-Davidsonian Style:
 - $\exists e \ Chasing(e) \land \ Chaser(e, Tom) \land ChasedThing(e, Jerry)$ $\land \ TimeOfChasing(e, Yesterday)$

Full Event Semantics

- Neo-Davidsonian Style:
 - $\exists e \ Chasing(e) \land \ Chaser(e, Tom) \land ChasedThing(e, Jerry)$ $\land \ TimeOfChasing(e, Yesterday)$
- Same across all examples

Full Event Semantics

- Neo-Davidsonian Style:
 - $\exists e \ Chasing(e) \land \ Chaser(e, Tom) \land ChasedThing(e, Jerry)$ $\land \ TimeOfChasing(e, Yesterday)$
- Same across all examples
- Roles: Chaser, Chased Thing, Time Of Chasing
 - Specific to verb "chase"
 - a.k.a. "Deep roles"

Main Idea

- Extract the semantic roles without doing full semantic parsing
- Easier problem, but still useful for many tasks
 - More data
 - Better models

- How many roles for a language?
 - Arbitrary!
 - Each verb's event structure determines sets of roles

- How can we acquire these roles?
 - Manual construction?
 - Some progress on automatic learning
 - Mostly successful on limited domains (ATIS, GeoQuery)

- Can we capture generalities across verbs/events?
 - Not really, each event/role is specific

Solution to instantiating a specific role for every verb

- Solution to instantiating a specific role for every verb
- Attempt to capture commonality between roles

- Describe common semantic roles of verbal arguments
 - e.g. subject of break is AGENT
 - AGENT: volitional cause
 - THEME: things affected by action

- Describe common semantic roles of verbal arguments
 - e.g. subject of break is AGENT
 - AGENT: volitional cause
 - THEME: things affected by action
- Enables generalization over surface order of arguments
 - John_{AGENT} broke the window_{THEME}
 - The rock INSTRUMENT broke the window THEME
 - The window THEME was broken by John AGENT

- Verbs take different roles
- The *break* verb could be formed as:

- Verbs take different roles
- The *break* verb could be formed as:
 - AGENT/Subject, THEME/Object

(John broke the window)

- Verbs take different roles
- The *break* verb could be formed as:
 - AGENT/Subject, THEME/Object (John broke the window)
 - AGENT/Subject, THEME/Object, INSTRUMENT/PP with (John broke the window with a rock)

- Verbs take different roles
- The break verb could be formed as:
 - AGENT/Subject, THEME/Object
 - AGENT/Subject, THEME/Object, Instrument/PPwith
 - INSTRUMENT/Subject, THEME/Object

(John broke the window)

(John broke the window with a rock)

(The rock broke the window)

- Verbs take different roles
- The break verb could be formed as:
 - AGENT/Subject, THEME/Object
 - AGENT/Subject, THEME/Object, Instrument/PPwith
 - INSTRUMENT/Subject, THEME/Object
 - THEME/Subject

(John broke the window)

(John broke the window with a rock)

(The rock broke the window)

(The window was broken)

- Thematic grid, Θ-grid, case frame
 - Set of thematic role arguments of verb
 - subject: AGENT; Object: THEME, or
 - subject: INSTR; Object:THEME

- Thematic grid, Θ-grid, case frame
 - Set of thematic role arguments of verb
 - subject: AGENT; Object: THEME, or
 - subject: INSTR; Object:THEME
- Verb/Diathesis Alternations
 - Verbs allow different surface realizations of roles
 - Doris_{AGENT} gave the book_{THEME} to Carv_{GOAL}
 - Doris_{AGENT} gave Carv_{GOAL} the book_{THEME}

Canonical Roles

| Thematic Role | Example |
|---------------|---|
| AGENT | The waiter spilled the soup |
| EXPERIENCER | John has a headache |
| FORCE | The wind blows debris from the mall into our yards. |
| THEME | Only after Benjamin Franklin broke the ice |
| RESULT | The French government has built a regulation-size baseball diamond |
| CONTENT | Mona asked "You met Mary Ann at a supermarket?" |
| INSTRUMENT | He turned to poaching catfish, stunning them with a shocking device |
| BENEFICIARY | Whenever Ann Callahan makes hotel reservations for her boss |
| Source | I flew in from Boston. |
| GOAL | I drove to Portland. |

Hard to produce

- Hard to produce
- Standard set of roles
 - Fragmentation: Often need to make more specific
 - e.g. INSTRUMENTS can be subject or not

- Hard to produce
- Standard set of roles
 - Fragmentation: Often need to make more specific
 - e.g. INSTRUMENTS can be subject or not

From Levin and Rappaport Hovav 2005:

- a. John broke the window with a rock.
- b. The rock broke the window.
- a. Swabha ate the banana with a fork.
- b. * The fork ate the banana.

- Hard to produce
- Standard set of roles
 - Fragmentation: Often need to make more specific
 - e.g. INSTRUMENTS can be subject or not
- Standard definition of roles
 - Most AGENTs: animate, volitional, sentient, causal
 - But not all... e.g.?

From Levin and Rappaport Hovav 2005:

- a. John broke the window with a rock.
- b. The rock broke the window.
- a. Swabha ate the banana with a fork.
- b. * The fork ate the banana.

- b. The rock broke the window.
- a. Swabha ate the banana with a fork.
- b. * The fork ate the banana.

[Google]_{Agent} found the answer.

- Strategies:
 - Generalized semantic roles: PROTO-AGENT/PROTO-PATIENT
 - Defined heuristically: PropBank
 - Semantic "proto"-roles: http://decomp.io/projects/semantic-proto-roles/
- Define roles specific to verbs/nouns: FrameNet

- Sentences annotated with semantic roles
 - Penn and Chinese Treebank
 - Roles specific to verb sense
 - Numbered: Arg₀, Arg₁, Arg₂, ...
 - Arg₀: Proto-Agent; Arg₁: Proto-Patient, etc

- Arguments >1 are Verb-specific
 - e.g. agree.01
 - Arg₀: Agreer
 - Arg₁: Proposition
 - Arg₂: Other entity agreeing
 - Ex1: [Arg0 The group] agreed [Arg1 it wouldn't make an offer]

- Resources:
 - Annotated sentences
 - Started w/Penn Treebank
 - Now: Google answerbank, SMS, webtext, etc
 - Framesets:
 - Per-sense inventories of roles, examples
 - Span verbs, adjectives, nouns (e.g. event nouns)

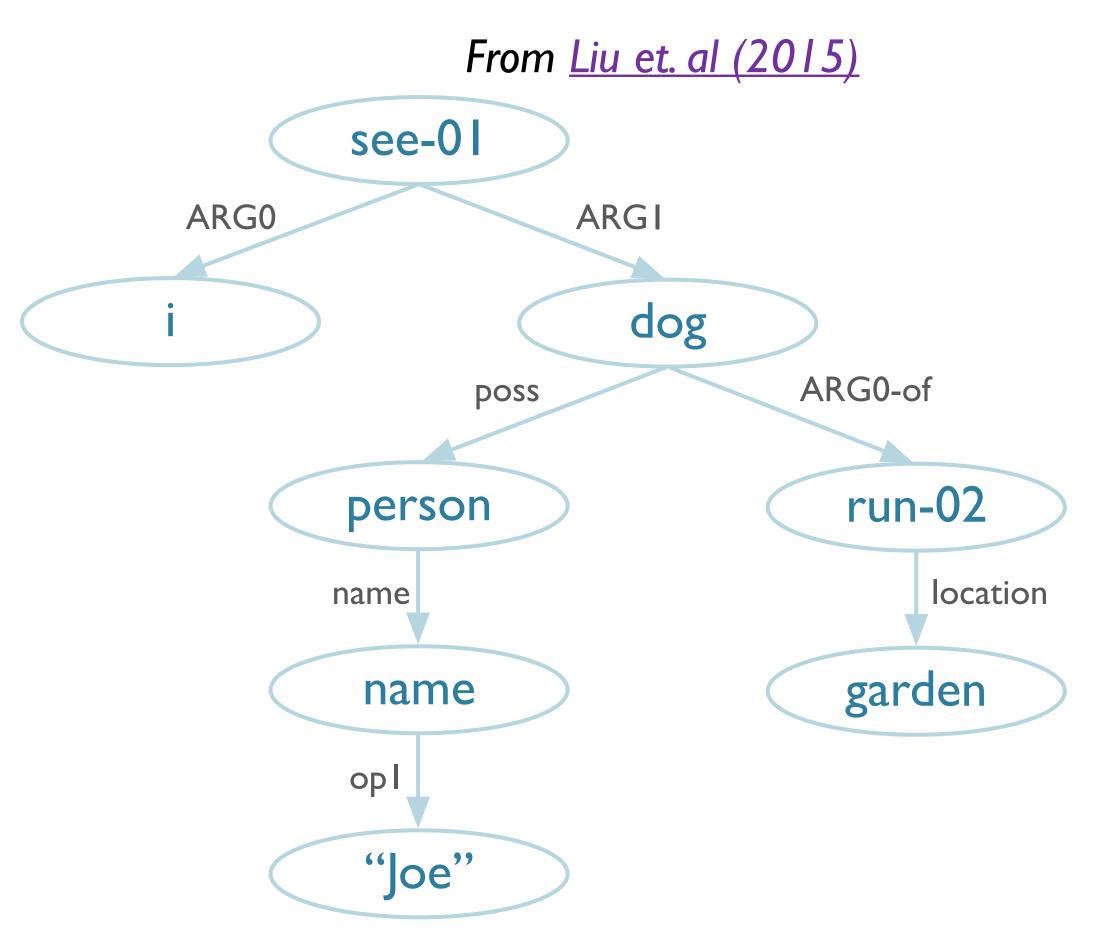

- propbank.github.io
- Recent status:
 - 5940 verbs w/8121 framesets
 - 1880 adjectives w/2210 framesets
- Continued into OntoNotes
- [CoNLL 2005 and 2012 shared tasks]

AMR

- "Abstract Meaning Representation"
 - Sentence-level semantic representation
- Nodes: Concepts
 - English words; PropBank: predicates; or keywords ('person')
- Edges: Relations
 - PropBank thematic roles (ARG0-ARG5)
 - Others including 'location,' 'name,' 'time,' etc...
 - ~100 in total

AMR 2

- AMR Bank: (now) ~40K annotated sentences
- JAMR parser: 63% F-measure (2015)
 - Alignments between word spans & graph fragments
- Example: "I saw Joe's dog, which was running in the garden."

AMR 3

- Towards full semantic parsing
- "Deeper" than base PropBank, but:
 - No real quantification
 - No articles
 - No real vs. hypothetical events (e.g. "wants to go")

FrameNet (Fillmore et al)

- Key insight:
 - Commonalities not just across different sentences w/same verb but across different verbs (and nouns and adjectives)

FrameNet (Fillmore et al)

- Key insight:
 - Commonalities not just across different sentences w/same verb but across different verbs (and nouns and adjectives)

- [Arg0 Big Fruit Co.] increased [Arg1 the price of bananas].
- [Arg1 The price of bananas] was increased by [Arg0 BFCo].
- [Arg1 The price of bananas] increased [Arg2 5%].

FrameNet (Fillmore et al)

Key insight:

 Commonalities not just across different sentences w/same verb but across different verbs (and nouns and adjectives)

PropBank

- [Arg0 Big Fruit Co.] increased [Arg1 the price of bananas].
- [Arg1 The price of bananas] was increased by [Arg0 BFCo].
- [Arg1 The price of bananas] increased [Arg2 5%].

FrameNet

- [ATTRIBUTE The price] of [ITEM bananas] increased [DIFF 5%].
- [ATTRIBUTE The price] of [ITEM bananas] rose [DIFF 5%].
- There has been a [DIFF 5%] rise in [ATTRIBUTE the price] of [ITEM bananas].

FrameNet

- Semantic roles specific to frame
 - Frame: script-like structure, roles (frame elements)
 - e.g. Change_Position_on_Scale: increase, rise
 - ATTRIBUTE; INITIAL_VALUE; FINAL_VALUE
 - Core, non-core roles
 - Relationships between frames, frame elements
 - Add causative: Cause_Change_Position_on_Scale

Change of position on scale

VERBS: dwindle edge advance explode climb decline fall fluctuate decrease diminish gain dip grow double increase drop jump

move mushroom plummet reach rise rocket shift skyrocket slide

soar
swell
swing
triple
tumble
NOUNS:

decline decrease escalation shift explosion tumble fall ADVERBS:

gain

hike

rise

growth

increase

increasingly

Core Roles

Core Roles

ATTRIBUTE The ATTRIBUTE is a scalar property that the ITEM possesses.

DIFFERENCE The distance by which an ITEM changes its position on the scale.

FINAL_STATE A description that presents the ITEM's state after the change in the ATTRIBUTE's value as an independent predication.

FINAL_VALUE The position on the scale where the ITEM ends up.

INITIAL_STATE A description that presents the ITEM's state before the change in the ATTRIBUTE's value as an independent predication.

INITIAL_VALUE The initial position on the scale from which the ITEM moves away.

ITEM The entity that has a position on the scale.

VALUE_RANGE A portion of the scale, typically identified by its end points, along which the values of the ATTRIBUTE fluctuate.

Some Non-Core Roles

DURATION The length of time over which the change takes place.

SPEED The rate of change of the VALUE.

GROUP The GROUP in which an ITEM changes the value of an ATTRIBUTE in a specified way.

FrameNet

- Current status:
 - 1224 frames
 - 13686 lexical units (mostly verbs, nouns)
 - 10749 frame element relations
 - Annotations over:
 - Newswire (WSJ, AQUAINT)
 - American National Corpus
- Under active development
- Still relatively limited coverage

Semantic Role Labeling

Semantic Role Labeling

Task of automatically assigning semantic roles for each argument

- Assign Parse to Input String
- Traverse parse to find all predicates
- For each predicate, examine each node and decide semantic role (if any)

```
function SEMANTICROLELABEL(words) returns labeled tree

parse←PARSE(words)

for each predicate in parse do

for each node in parse do

featurevector←EXTRACTFEATURES(node, predicate, parse)

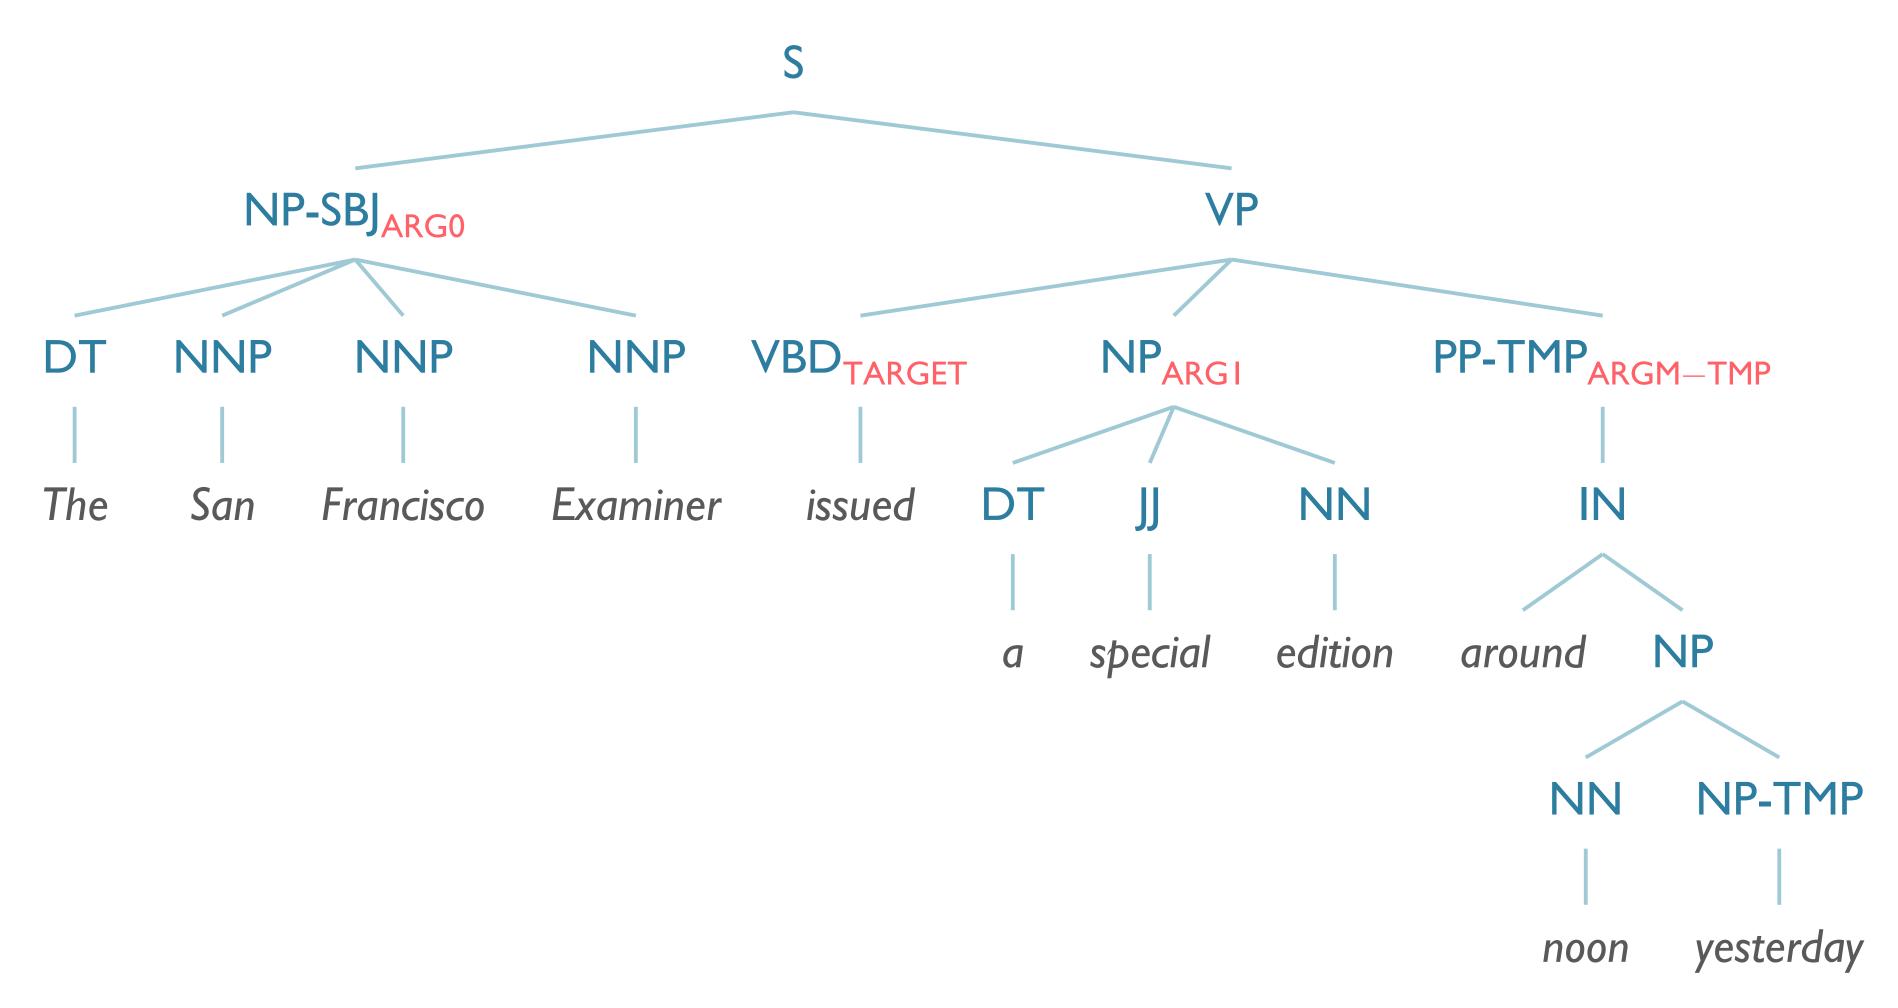

CLASSIFYNODE(node, featurevector, parse)
```

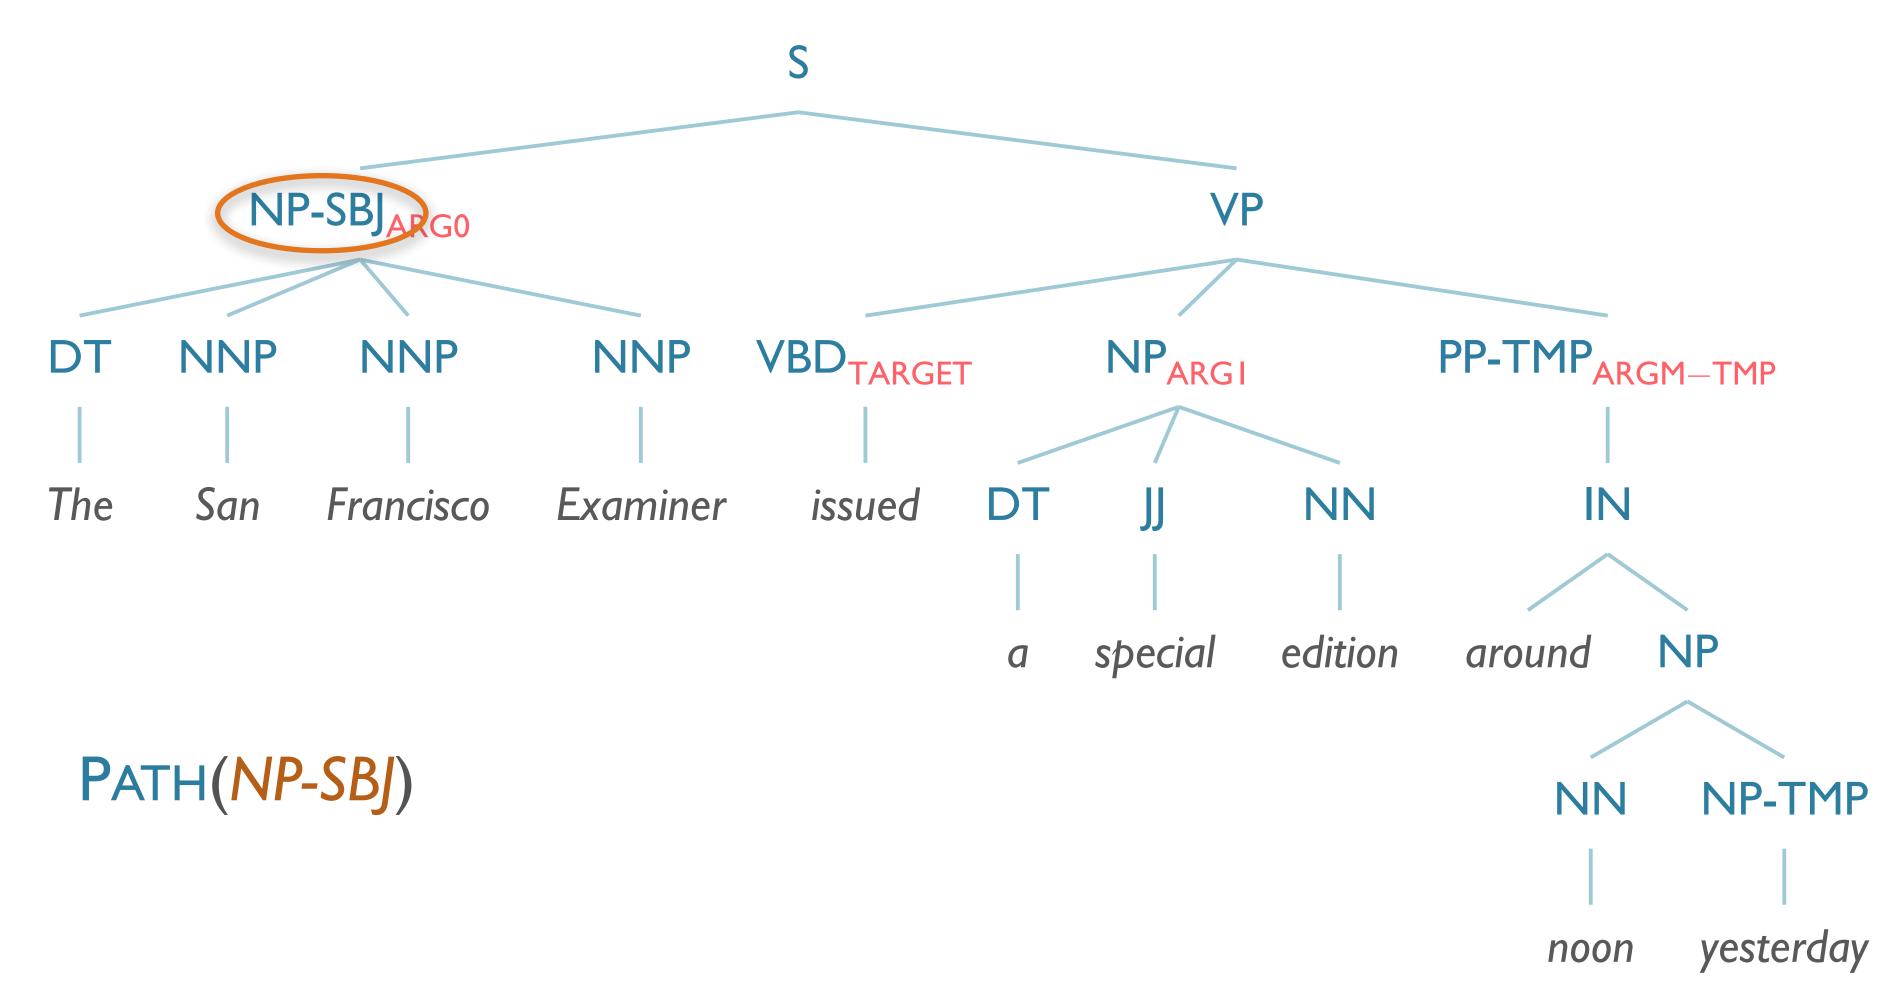

J&M 3rd ed, <u>ch 20.6</u>

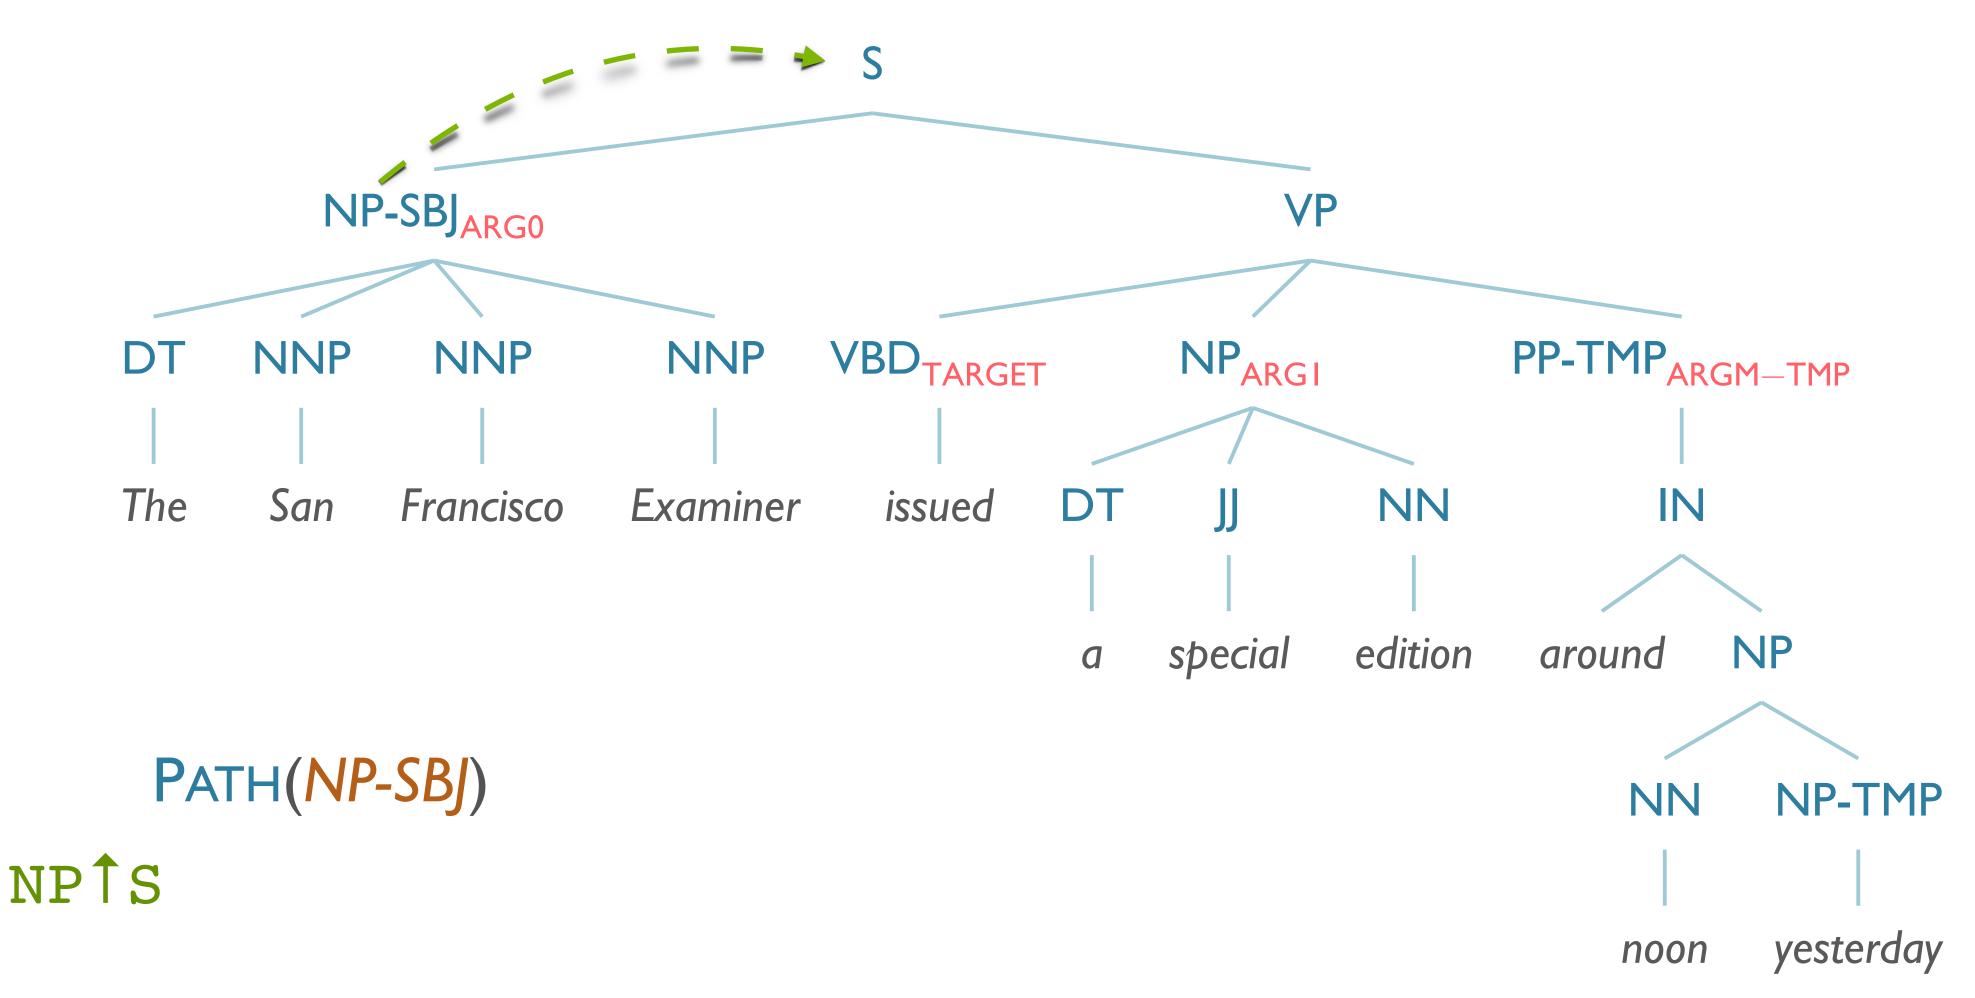

Semantic Role Labeling Features

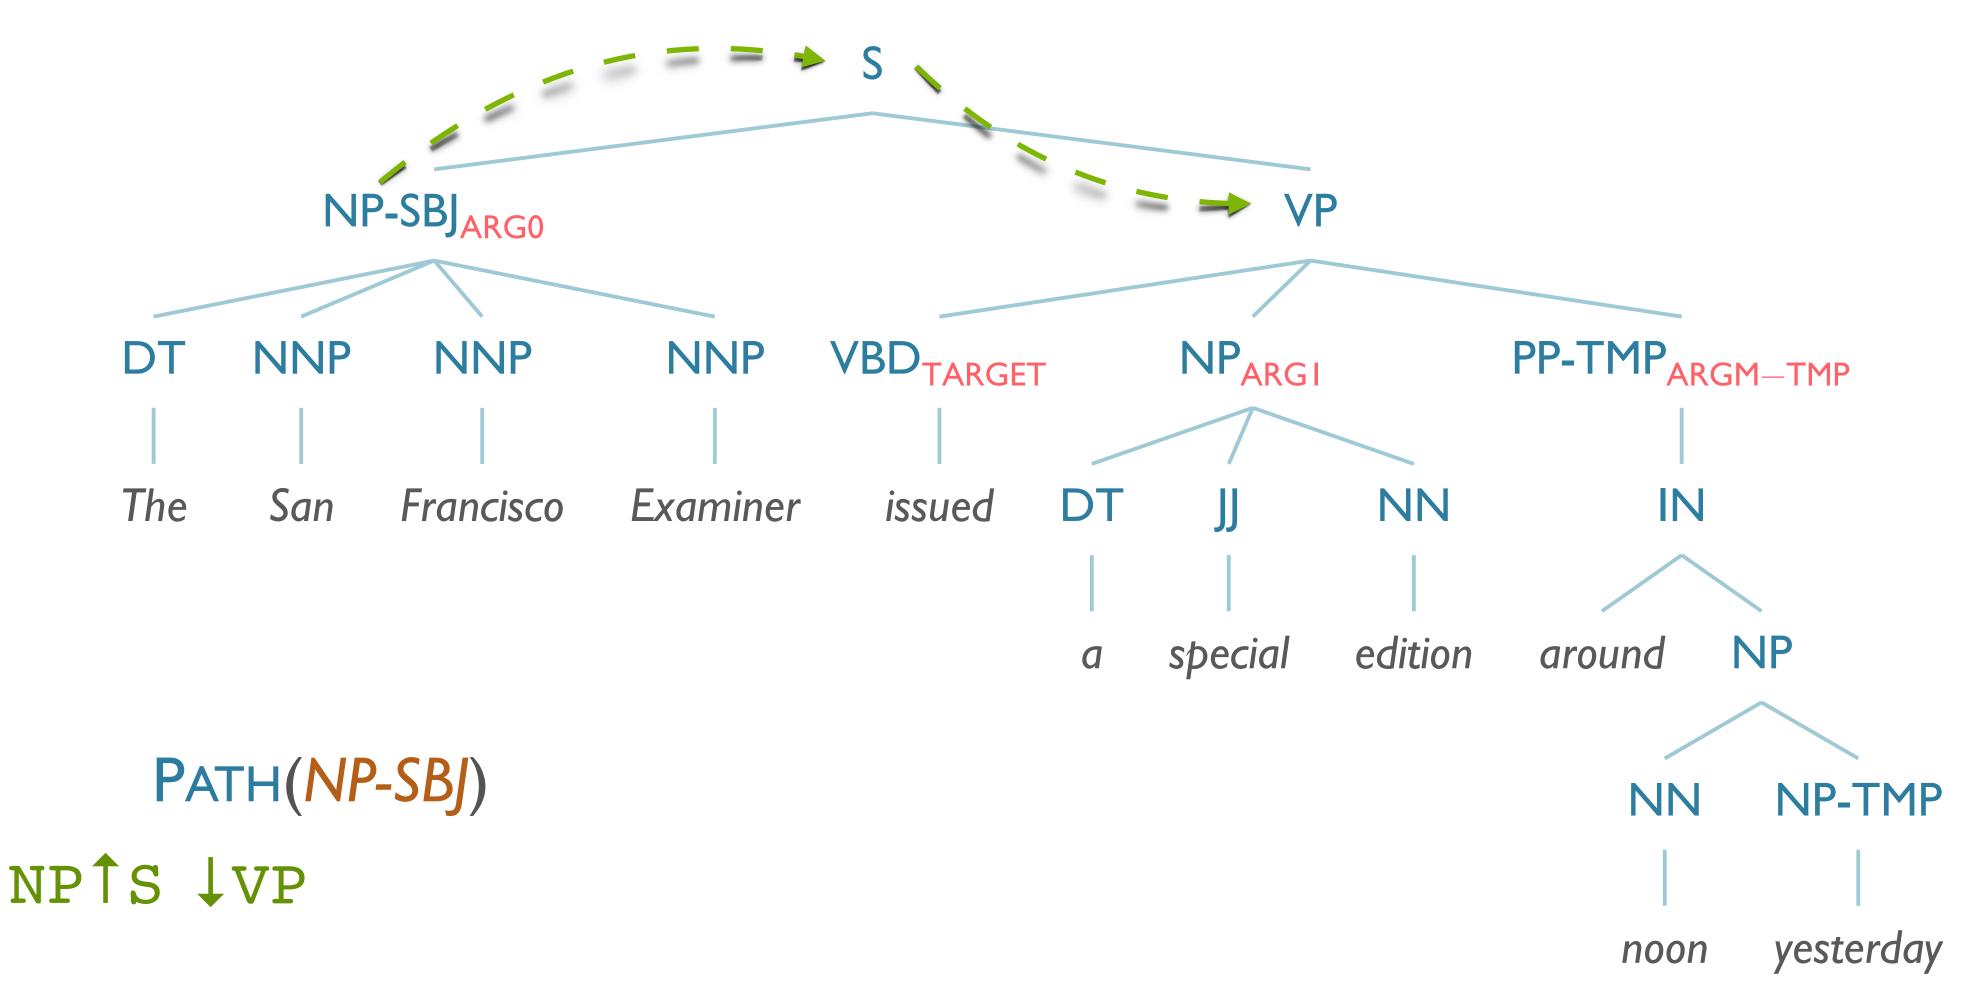

- Governing predicate
- Phrase Type (NP, VP, etc)
- Headword of constituent
- Headword POS
- PATH from current node to predicate (NP1S\VP\VBD)

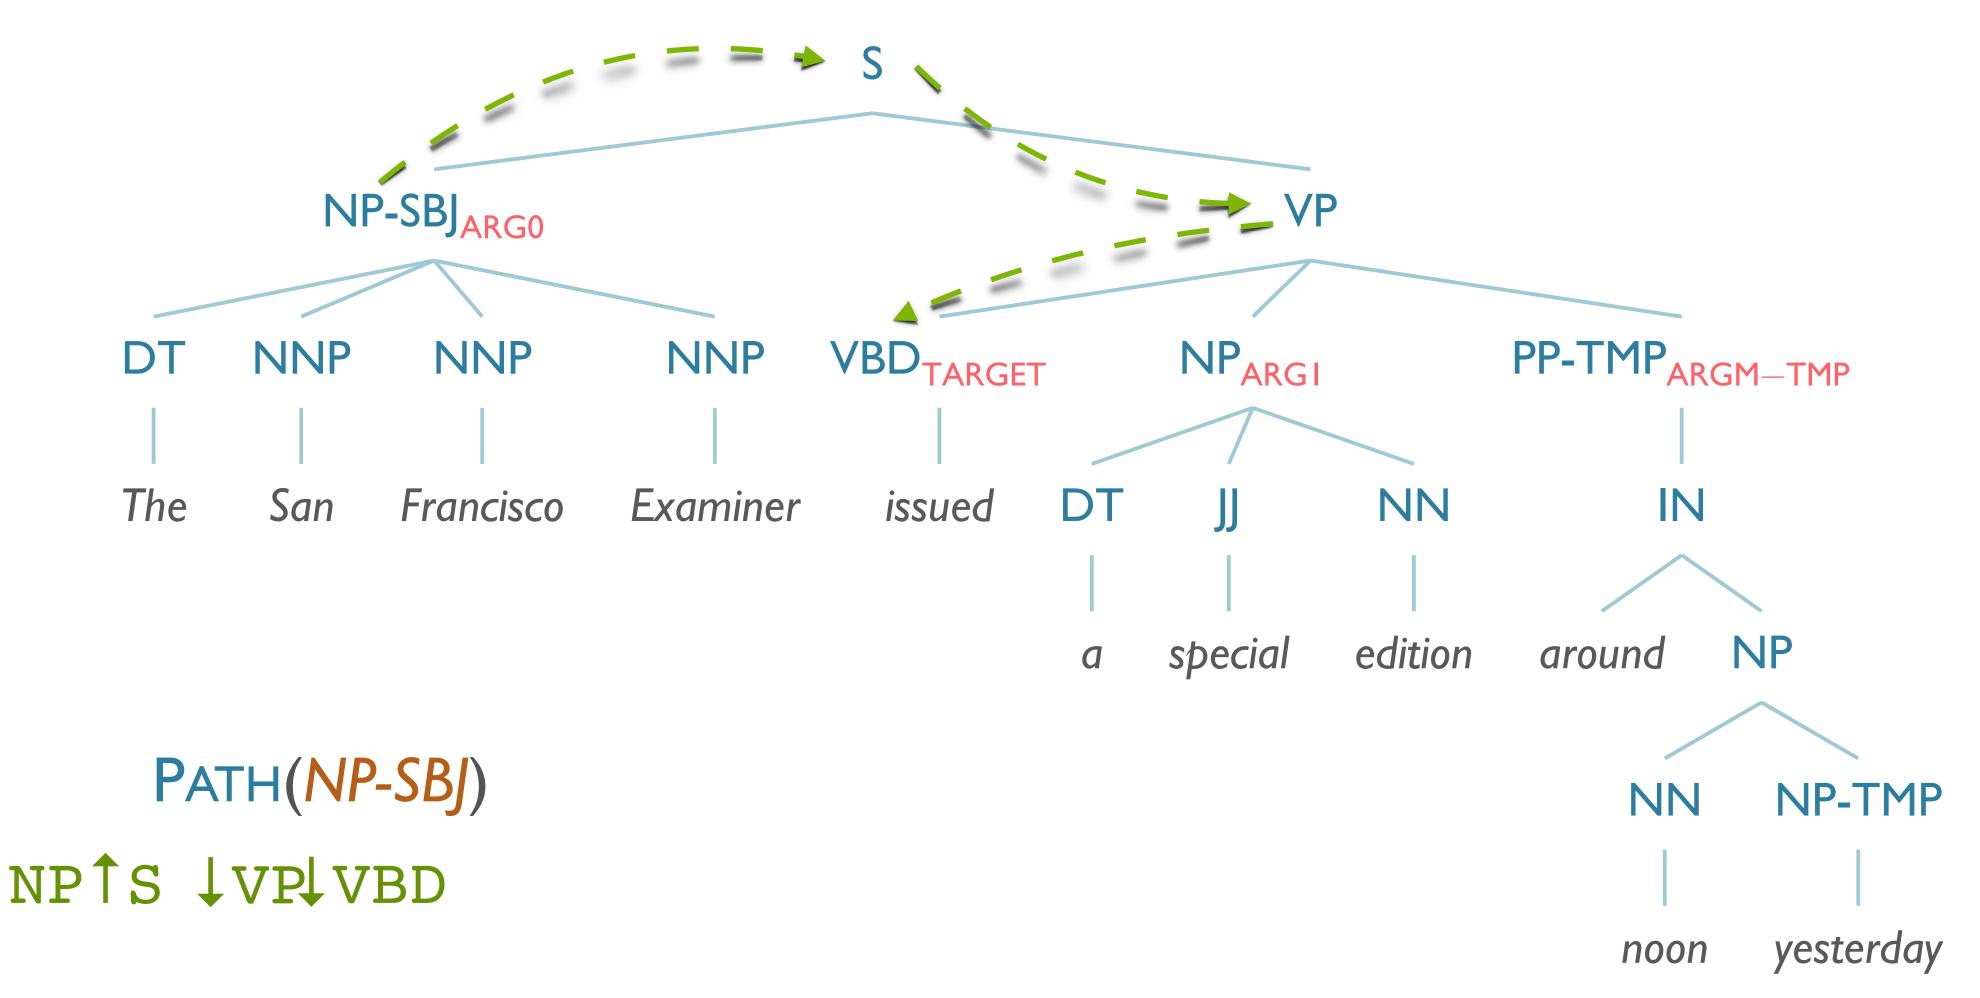

• ...

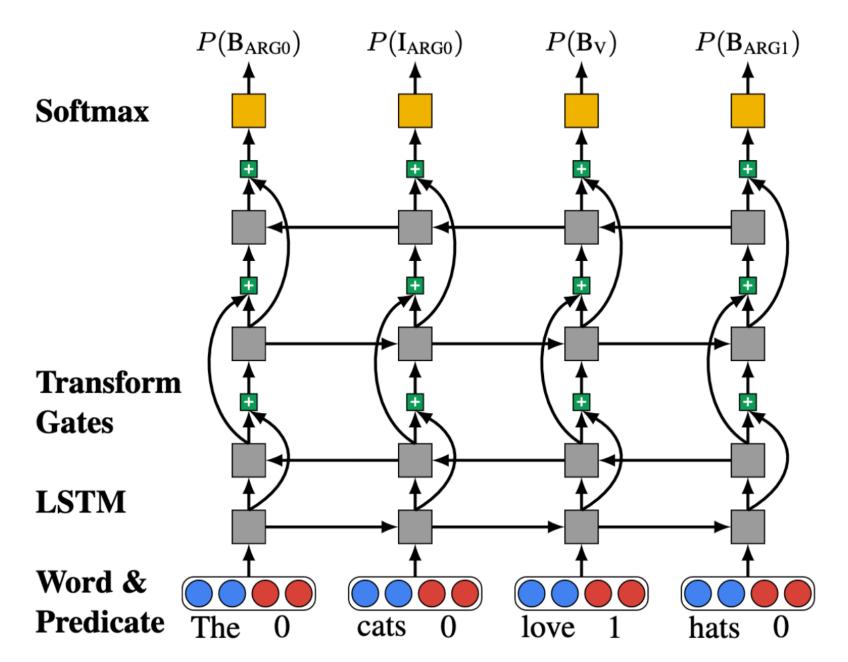

Some Semantic Role Labeling Applications

- Question answering:
 - Who did what to whom?
- Machine translation
 - Maintain agents/thematic roles through translation
- Dialogue systems

Scaling up SRL

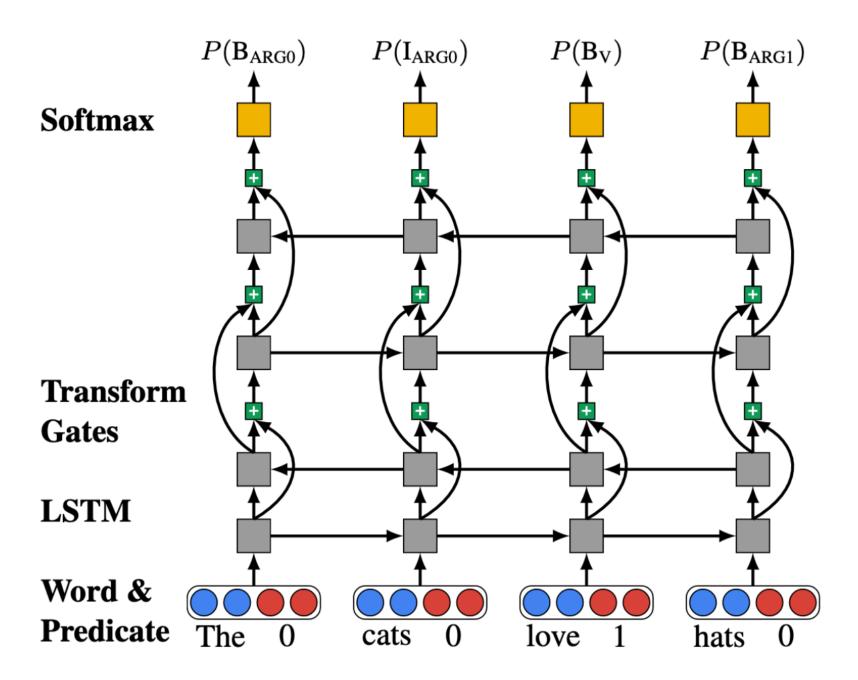

Neural SRL

He et al 2017

Question-Answer Driven Semantic Role Labeling: Using Natural Language to Annotate Natural Language

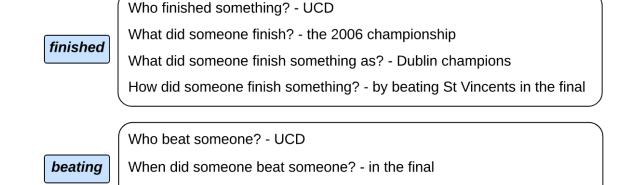

Luheng He Mike Lewis Luke Zettlemoyer

Computer Science & Engineering University of Washington Seattle, WA

{luheng, mlewis, lsz}@cs.washington.edu

Abstract

This paper introduces the task of questionanswer driven semantic role labeling (QA-SRL), where question-answer pairs are used to represent predicate-argument structure. For example, the verb "introduce" in the previous sentence would be labeled with the questions "What is introduced?", and "What introduces something?", each paired with the phrase from the sentence that gives the correct answer. Posing the problem this way allows the questions themselves to define the set of possible roles, without the need for predefined frame or thematic role ontologies. It also allows for scalable data collection by annotators with very little training and no linguistic expertise. We gather data in two UCD *finished* the 2006 championship as Dublin champions, by *beating* St Vincents in the final.

Who did someone beat? - St Vincents

Figure 1: QA-SRL annotations for a Wikipedia sentence.

(ARG0, ARG1, etc.). Existing task definitions can be complex and require significant linguistic expertise to understand, causing challenges for data annotation and use in many target applications.

In this paper, we introduce a new question-
